PATENT

In the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A transflective liquid crystal display device comprising a liquid
2 crystal panel, which has a transmissive region and a reflective region in each pixel, constructed
of a first and a second substrate faced with each other, characterized in that said first substrate
4 comprises a reflecting member arranged in a first region other than the transmissive region, and
said second substrate comprises a scattering member arranged only in at least part of the
6 transmissive region.
2. (Currently Amended) A device according to claim 1, wherein said second substrate
2 comprises other scattering member arranged in a second region corresponding to said first
reflective region, the other scattering member having a lower scattering effect than that of said
4 scattering member.
3. (Currently Amended) A transflective liquid crystal display device comprising a liquid
2 crystal panel, which has a transmissive region and a reflective region in each pixel, constructed
of a first and a second substrate faced with each other, characterized in that said first substrate
4 comprises a reflecting member arranged in a first region other than the transmissive region, and
said second substrate comprises a first color filter having a scattering effect arranged in ~~at least~~
6 ~~part of~~ the transmissive region and a second color filter arranged in a second region
corresponding to said reflective ~~first~~ region.
4. (Original) A device according to claim 3, wherein said first color filter has a color
2 different from that of said second color filter.
5. (Currently Amended) A method of providing a transflective liquid crystal display device
2 comprising a liquid crystal panel, which has a transmissive region and a reflective region in each

PATENT

pixel, constructed of a first and a second substrate faced with each other, said method comprising

4 ~~the steps of:~~

arranging a reflecting member in a first region other than the transmissive region of said

6 first substrate; and

arranging a scattering member in at least part of the transmissive region of said second

8 substrate, but not in said first region.

6. (Original) A method according to claim 5, further comprising the step of arranging other
2 scattering member in a second region of said second substrate corresponding to said first region,
the other scattering member having a lower scattering effect than that of said scattering member.

7. (Currently Amended) A method of transfective liquid crystal display device comprising
2 a liquid crystal panel, which has a transmissive region and a reflective region in each pixel,
constructed of a first and a second substrate faced with each other, comprising the steps of:

4 arranging a reflecting member in a first region other than the transmissive region of said
first substrate;

6 arranging a first color filter having a scattering effect only in at least part of the
transmissive region of said second substrate; and

8 arranging a second color filter in a second region of said second substrate corresponding
to said first region.
